

I want to create a personal digital chord-and-lyrics library for piano that works mainly from my iPad but is accessible from my phone anywhere.

The idea is that I would use my iPad to create clean lyric PDFs for songs, formatted with enough space between the lines. Then I would use Apple Pencil to write my own chords above the lyrics, exactly where I want them. This would let me make my own versions of songs instead of relying on online chord sheets, which are sometimes wrong, too simple, or not arranged the way I would personally play them.

After marking up each song, I would save it as a finished chord-and-lyrics PDF. These PDFs would then be stored in an organized cloud-based folder system, sorted by categories such as artist, genre, musical theater, Disney, pop, jazz standards, or other useful groupings.

The goal is to build my own personalized digital fake book: easy to create and annotate on my iPad, easy to organize into folders, and easy to pull up from my phone at any time, anywhere, whenever someone asks me to play a song.
